Key Topics Covered in Biology Second Semester Final Exam Review

1. Genetics and Heredity

Genetics forms a core part of the second semester curriculum, focusing on inheritance patterns, DNA structure, and gene expression.

Review Answers for Genetics

- What is Mendel's Law of Segregation?

Answer: Mendel's Law of Segregation states that during the formation of gametes, the two alleles for a gene separate, so each gamete carries only one allele for each gene. This ensures genetic variation in offspring.

- Explain independent assortment.

Answer: Independent assortment refers to the principle that genes for different traits assort independently during gamete formation, leading to various combinations of traits in offspring.

- Describe the structure of DNA.

Answer: DNA is a double helix composed of two strands of nucleotides. Each nucleotide contains a sugar (deoxyribose), a phosphate group, and a nitrogenous base (adenine, thymine, cytosine, guanine). The bases pair specifically: A with T, and C with G.

- What is the process of DNA replication?

Answer: DNA replication involves unwinding the double helix, pairing complementary nucleotides with each original strand, and forming two identical DNA molecules through enzymes like DNA polymerase.

- Define mutation and its types.

Answer: A mutation is a change in the DNA sequence. Types include point mutations (single nucleotide changes), insertions, deletions, and chromosomal mutations.

2. Evolution and Natural Selection

Evolution explains how species change over time, driven by natural selection, genetic drift, and mutation.

Review Answers for Evolution

- What is natural selection?

Answer: Natural selection is the process where organisms with advantageous traits are more likely to survive and reproduce, passing those traits to offspring, leading to evolutionary change.

- Describe Darwin's theory of evolution by natural selection.

Answer: Darwin proposed that variation exists within populations; individuals with beneficial traits are more likely to survive and reproduce, causing these traits to become more common over generations.

- What is fitness in evolutionary terms?

Answer: Fitness refers to an organism's ability to survive and reproduce in its environment, contributing genes to the next generation.

- Explain genetic drift.

Answer: Genetic drift is a random change in allele frequencies within a population, often occurring in small populations, which can lead to significant genetic shifts over time.

3. Ecology and Ecosystems

Ecology studies interactions among organisms and their environment, focusing on ecosystems, food webs, and conservation.

Review Answers for Ecology

- Define an ecosystem.

Answer: An ecosystem is a community of living organisms interacting with each other and with non-living components like air, water, and soil in a specific area.

- What is the difference between biotic and abiotic factors?

Answer: Biotic factors are living components (plants, animals, bacteria), while abiotic factors are non-living components (temperature, sunlight, pH).

- Explain the concept of a food chain and food web.

Answer: A food chain shows a linear flow of energy from producers to consumers. A food web is a complex network of interconnected food chains, illustrating multiple feeding relationships.

- What are keystone species?

Answer: Keystone species are organisms that have a disproportionately large impact on their ecosystem relative to their abundance, maintaining the structure of an ecosystem.

4. Human Anatomy and Physiology

This section covers the structure and functions of human body systems studied in the second semester.

Review Answers for Human Anatomy

- Describe the structure of the circulatory system.

Answer: The circulatory system consists of the heart, blood vessels (arteries, veins, capillaries), and blood. It transports oxygen, nutrients, hormones, and waste products throughout the body.

- What are the main functions of the respiratory system?

Answer: The respiratory system facilitates gas exchange, supplying oxygen to the blood and removing carbon dioxide.

- Explain how the digestive system works.

Answer: The digestive system breaks down food into absorbable nutrients through mechanical and chemical processes, then absorbs nutrients into the bloodstream, and expels waste.

- Identify major parts of the human brain.

Answer: Major parts include the cerebrum (thought, memory), cerebellum (balance, coordination), brainstem (vital functions), and limbic system (emotion, memory).

5. Cell Structure and Function

Understanding cell biology is fundamental, covering cell types, organelles, and processes like mitosis and meiosis.

Review Answers for Cell Biology

- What are the main differences between prokaryotic and eukaryotic cells?

Answer: Prokaryotic cells lack a nucleus and membrane-bound organelles, are generally smaller, and include bacteria. Eukaryotic cells have a nucleus, membrane-bound organelles, and make up plants, animals, and fungi.

- Describe the function of the mitochondria.

Answer: Mitochondria are the powerhouses of the cell, generating ATP through cellular respiration.

- What is the cell cycle?

Answer: The cell cycle includes phases of growth (G1), DNA replication (S), preparation for division (G2), and mitosis, leading to cell division.

- Explain the process of meiosis.

Answer: Meiosis is a specialized cell division producing four haploid gametes, reducing chromosome number by half, essential for sexual reproduction.

Prokaryotic cells (bacteria and archaea) lack a nucleus and membrane-bound organelles, whereas eukaryotic cells (plants, animals, fungi) have a nucleus and specialized organelles.

Key differences:

- Nucleus presence (absent in prokaryotes)
- Size (prokaryotes are usually smaller)
- Organelles (e.g., mitochondria, endoplasmic reticulum in eukaryotes)

- Major Cell Organelles and Functions:

- Nucleus: Contains genetic material, controls cell activities
- Mitochondria: Powerhouse, produces ATP via cellular respiration
- Ribosomes: Site of protein synthesis

b. Cellular Processes

- Photosynthesis:

Definition: Process by which chloroplasts convert light energy into chemical energy (glucose).

Equation:

Stages: Light-dependent reactions and Calvin cycle (light-independent reactions).

Significance: Produces oxygen and organic compounds vital for life.

- Cellular Respiration:

Definition: Process of breaking down glucose to produce ATP.
