the refrigerant flows through the system, carrying heat away from the chamber.

Condenser Coil:

Located outside the storage chamber, the condenser coil releases heat to the surrounding environment. As the refrigerant passes through, it condenses from vapor to liquid.

Expansion Valve:

This device reduces the pressure of the refrigerant, allowing it to expand and cool before entering the evaporator coil.

Evaporator Coil:

Inside the storage chamber, the refrigerant absorbs heat as it vaporizes, lowering the temperature inside. This process must be carefully controlled to maintain the desired temperature.

Control and Monitoring Block

Temperature Sensors and Thermostats:

Placed inside the storage chamber, they continuously monitor temperature levels and send signals to control devices.

Control Panel:

The central interface for adjusting temperature settings, activating safety features, and diagnosing system issues.

Safety Devices:

Includes pressure relief valves, overload protectors, and alarms to prevent system failures and ensure safety.

Air Circulation and Insulation Block

Fans/Air Circulators:

Ensure uniform distribution of cooled air throughout the chamber, avoiding hot spots.

Insulated Storage Chamber:

Auxiliary Systems Block

Defrost System:

Prevents ice buildup on coils, which can impair heat exchange efficiency. May be time- or temperature-based.

Alarm and Safety Systems:

Alert personnel in case of temperature deviations, equipment failure, or safety hazards.

Working Principle of a Mortuary Refrigeration System

The system operates on the vapor-compression refrigeration cycle:

- Compression: The compressor compresses refrigerant vapor, raising its temperature and pressure.
- Condensation: The hot, high-pressure refrigerant flows through the condenser coil, releasing heat to the environment and condensing into a liquid.
- Expansion: The high-pressure liquid passes through the expansion valve, reducing its pressure and temperature.
- Evaporation: The cooled refrigerant absorbs heat inside the evaporator coil within the storage chamber, vaporizing in the process and cooling the interior.
- Repeat Cycle: The refrigerant vapor returns to the compressor, and the cycle continues to maintain the set temperature.

This cycle ensures continuous removal of heat, keeping the storage environment at a consistent low temperature suitable for mortuary needs.
