- a) Amplify signals
- b) Rectify AC into DC
- c) Store electrical energy
- d) Regulate voltage

Answer: b) Rectify AC into DC

Explanation:

A diode is a semiconductor device that allows current to flow in one direction only. Its primary function in circuits is to convert alternating current (AC) into direct current (DC), which is essential in power supply applications. While diodes can also be used for voltage regulation and signal demodulation, their main role in basic electronics is rectification.

- d) Silicon doped with phosphorus

Answer: b) Silicon with holes

Explanation:

P-type semiconductors are created by doping silicon with elements like boron, which create an excess of holes (positive charge carriers). These holes facilitate current flow when an electric field is applied. Conversely, n-type semiconductors are doped with elements like phosphorus, which provide excess electrons.

Question 3: In an RC circuit, what is the time constant (?) defined as?

- a) $R \times C$
- b) $R + C$
- c) R / C
- d) C / R

Answer: a) $R \times C$

Explanation:

The time constant (τ) for an RC circuit is the product of resistance (R) and capacitance (C). It indicates how quickly the capacitor charges or discharges; specifically, after a time equal to τ , the voltage across the capacitor reaches approximately 63.2% of its final value.
