Key Concepts and Theoretical Foundations

Linear Independence and Dependence

Understanding whether vectors are linearly independent is crucial for defining bases and dimensions.

- Vectors $v_1, v_2, \dots, v_k$ are linearly independent if the only solution to $a_1v_1 + a_2v_2 + \dots + a_kv_k = 0$ is $a_i = 0$ for all i .
- Dependent vectors can be expressed as linear combinations of others, simplifying the basis selection process.

Eigenvalues and Eigenvectors

These are critical for understanding matrix transformations and system dynamics.

- Eigenvalues are scalars λ such that $Av = \lambda v$ for some non-zero vector v (the eigenvector).
- Eigenvalues determine the nature of linear transformations, including stability and oscillations in systems.

Diagonalization

Diagonalization simplifies matrix powers and functions, essential in differential equations and systems theory.

- A matrix A is diagonalizable if there exists an invertible matrix P such that $P^{-1}AP = D$, where D is diagonal.
- Diagonalization relies on the existence of enough linearly independent eigenvectors.

Inner Products and Orthogonality

These concepts extend the geometric intuition of angles and lengths to abstract vector spaces.

- Inner product spaces allow definitions of length (norm) and angles, facilitating the study of orthogonal projections.
- Orthonormal bases simplify computations and are fundamental in Fourier analysis, signal processing, and data analysis.

Spectral Theorem

A cornerstone in linear algebra for symmetric matrices, stating that every real symmetric matrix can be orthogonally diagonalized.

- Provides a way to decompose matrices into their spectral components.
- Enables efficient computation of matrix functions, such as matrix exponentials.
