Section 1 Reinforcement Electric Charge Answer Key

Understanding electric charge is fundamental in physics, especially when exploring the nature of electricity and electrostatics. For students and educators alike, mastering the concepts in Section 1 of electrostatics can be challenging, which is why having a comprehensive answer key is invaluable. This article provides a detailed guide to the answer key for Section 1 reinforcement exercises on electric charge, helping learners verify their understanding, clarify doubts, and deepen their grasp of core principles.

Introduction to Electric Charge

Electric charge is a property of matter that causes it to experience a force when placed in an electric field. It is a fundamental property, much like mass, and exists in two types: positive and negative.

Basic Concepts

- Definition of Electric Charge: A physical property of particles that causes them to attract or repel each other.
- Unit of Electric Charge: Coulomb (C)
- Elementary Charge: The smallest unit of charge, approximately 1.6×10^{-19} C, carried by protons and electrons.

Types of Electric Charges

- Positive Charge: Carried by protons
- Negative Charge: Carried by electrons
- Neutral: An object with equal amounts of positive and negative charges

Key Concepts Covered in Section 1

In the exercises, students typically encounter the following topics:

- Charge conservation
- Coulomb's Law
- Conductors and insulators
- Charging methods
- Coulomb's Law applications
- Electric force and field

Charge Conservation

- The total electric charge in an isolated system remains constant.
- When objects are charged through contact or induction, charges are redistributed but conserved overall.

Coulomb's Law

- Describes the force between two point charges.
- Expressed as:

$$F = k \times |q_1 \times q_2| / r^2$$

where

- F is the magnitude of the electrostatic force
- k is Coulomb's constant ($\sim 9 \times 10^9 \text{ Nm}^2/\text{C}^2$)
- q_1 and q_2 are the magnitudes of the charges
- r is the distance between the charges

Conductors and Insulators

- Conductors: Materials that allow free movement of electrons (e.g., metals)
- Insulators: Materials that do not allow free electron movement (e.g., rubber, plastic)

Charging Methods

- Charging by friction: Rubbing two objects transfers electrons
- Charging by conduction: Contact with a charged object transfers charge

- Charging by induction: Bringing a charged object near a neutral object causes charge separation

Sample Questions and Answer Key

Below are common questions from Section 1 exercises, with detailed solutions and explanations.

Question 1: Define electric charge and state its SI unit.

Answer:

Electric charge is a property of matter that causes particles to experience a force in an electric field. Its SI unit is the Coulomb (C).

Explanation: The Coulomb is defined as the amount of charge transferred when a current of one ampere flows for one second.

Question 2: State Coulomb's Law and explain each term.

Answer:

Coulomb's Law states that the electrostatic force between two point charges is directly proportional to the product of their magnitudes and inversely proportional to the square of the distance between them.

Mathematically:

$$F = k \times |q_1 \times q_2| / r^2$$

where:

- F: Magnitude of the force (Newtons, N)
- k: Coulomb's constant ($\sim 9 \times 10^9 \text{ Nm}^2/\text{C}^2$)
- q_1, q_2 : Magnitudes of the charges (Coulombs, C)
- r: Distance between the charges (meters, m)

Explanation: The law indicates that larger charges exert stronger forces, and increasing the distance weakens the force.

Question 3: How does charging by friction work? Provide an example.

Answer:

Charging by friction involves rubbing two objects together, causing electrons to transfer from one object to another due to differences in their electron affinity. The object losing electrons becomes positively charged, while the one gaining electrons becomes negatively charged.

Example: Rubbing a glass rod with silk transfers electrons, charging the glass positively and the silk negatively.

Question 4: What is the difference between conductors and insulators? Give two examples of each.

Answer:

- Conductors: Materials that allow free movement of electrons, enabling electric charges to flow easily.

Examples: Copper, Aluminum

- Insulators: Materials that do not allow free movement of electrons, preventing charge flow.

Examples: Rubber, Plastic

Explanation: Conductors are used in electrical wiring, while insulators are used to prevent unwanted current flow.

Question 5: Two point charges, $+3 \times 10^{-6} \text{ C}$ and $-2 \times 10^{-6} \text{ C}$, are separated by 0.5 meters. Calculate the force between them using Coulomb's Law.

Answer:

Given:

$$q_1 = +3 \times 10^{-6} \text{ C}$$

$$q_2 = -2 \times 10^{-6} \text{ C}$$

$$r = 0.5 \text{ m}$$

$$k = 9 \times 10^9 \text{ Nm}^2/\text{C}^2$$

Calculate the magnitude of force:

$$F = k \times |q_1 \times q_2| / r^2$$

$$F = (9 \times 10^9) \times (3 \times 10^{-6}) \times (2 \times 10^{-6}) / (0.5)^2$$

$$F = 9 \times 10^9 \times 6 \times 10^{-12} / 0.25$$

$$F = (54 \times 10^{-3}) / 0.25$$

$$F = 0.216 \text{ N}$$

Result:

The force magnitude is 0.216 Newtons, with the direction attractive because the charges are opposite.

Common Mistakes and Clarifications

Many students make misconceptions such as:

- Confusing the sign of charges with the direction of forces.
- Forgetting to convert microcoulombs to coulombs.
- Misapplying Coulomb's Law for multiple charges.
- Assuming charges can be created or destroyed, violating conservation.

Clarifications:

- The force is attractive if charges are opposite and repulsive if like charges.
- Always convert units to Coulombs before calculations.
- Remember Coulomb's Law applies for point charges; for continuous charge distributions, calculus-based methods are required.

Additional Tips for Mastery

- Practice problems involving both magnitude and direction of forces.

- Visualize electric field lines to understand charge interactions better.
- Use diagrams to represent charge distributions and forces.
- Review the concepts of electric potential and potential energy for a comprehensive understanding.

Key Points:

- The SI unit of electric charge is the Coulomb (C).
- The elementary charge (the charge of a single proton or electron) is approximately 1.602×10^{-19} C.
- Like charges repel; opposite charges attract.

The Importance of the Answer Key in Section 1 Reinforcement

well-structured answer key not only provides correct answers but also explains why those answers are correct, fostering deeper comprehension.

Core Concepts in Electric Charge

- Coulomb's Law

Coulomb's Law describes the force (F) between two point charges:

[

$$F = k_e \frac{|q_1 q_2|}{r^2}$$

]

Where:

- F is the magnitude of the force,
- $(k_e \approx 8.988 \times 10^9, \text{Nm}^2/\text{C}^2)$ is Coulomb's constant,
- (q_1, q_2) are the magnitudes of the charges,
- (r) is the distance between the charges.

Implications:

- The force is directly proportional to the product of the charges.
- The force diminishes with the square of the distance.

- Electric Field

The electric field (E) at a point in space due to a charge (q) :

[

$$E = k_e \frac{|q|}{r^2}$$

]

- Direction: Radially outward from a positive charge, inward toward a negative charge.
- Units: N/C.

- Electric Potential and Potential Difference

Electric potential (V) relates to the work done in moving a charge in an electric field:

[

$$V = k_e \frac{q}{r}$$

]

- Potential difference (ΔV) between two points is:

[

$$\Delta V = V_b - V_a$$

]

- Work done to move a charge:

[

$$W = q \Delta V$$

]
